Viewing, Using, and Creating PDF Files

Files with the extension .pdf are in a special format called portable document format. These files are often used on the web because users can open them using the free Acrobat Reader software. For example, if you link to a Word document or post one on Blackboard or the web, the user would have to have MS Word installed on his or her computer in order to view the file. By storing your Word document in .pdf format, anyone can open and view it as long as they have the Adobe Acrobat Reader software installed. Word files, PowerPoint printouts, and many other files can be saved in .pdf format.

Downloading Acrobat Reader

Many computers already have Acrobat reader installed. If you are not able to open a .pdf file you need to download and install the reader. To do this go to http://www.adobe.com/products/acrobat/readstep2.html and follow the directions on the screen. Once you have installed the reader, .pdf files will automatically launch the reader and be displayed within the reader software. You can then view, print the file, or copy and paste text from the file.

Creating .pdf Files

A freeware program, Cute PDF Writer, can be downloaded and installed on your computer. This program will let you convert your files into .pdf format. To download Cute PDF Writer:

Go to http://www.acrosoftware.com/Products/CutePDF/writer.asp and download both files by clicking on the links on the left side of the screen. Once you have downloaded the files, install them by clicking on the downloaded file. Once these files are installed, you can create .pdf files by choosing the print option from any program and selecting the Cute PDF Writer from the printer selection dialog box. You will be prompted to name the files and you can save it to the location you choose. (Note: .pdf files cannot be modified.)
